S&I Data Provenance Initiative Introduction to ISO/HL7 Standards for EHR Record Lifecycle and Lifespan

Gary Dickinson, Co-Chair, HL7 EHR WG
Diana Warner, Co-Facilitator, HL7 RM-ES WG
Reed Gelzer, MD, Co-Facilitator, HL7 RM-ES WG
26 June 2014

Key Standards References

Record Lifecycle Events

- 2004 –
 ISO 21089 Trusted End-to-End Information Flows
 - Now in revision
- 2008 –
 HL7 EHR Lifecycle Model DSTU
- 2014 –
 ISO/HL7 10781 EHR System Functional Model R2
 - Record Infrastructure (RI) Section
 - Includes HL7 EHR Lifecycle Model DSTU
 - Includes Records Management/Evidentiary Support (RM-ES)
 Functional Profile Release 1

Actions, Actors, Record Entries

- Actions are taken:
 - To support patient health;
 - In provision of healthcare to individuals;
 - As the result of rules-based EHR System algorithms.
- Actors (i.e., patients, providers, users, systems) take Actions.
- Actions broadly encompass tasks, acts, procedures or services performed or provided.
- The EHR System captures Actions taken and creates corresponding Record Entries.
 - Action instances are documented by EHR Record Entry instances.
- Record Entries provide persistent evidence of Action occurrence, context, disposition, facts, findings and observations.

Metadata, Signatures, Chronology

- Record Entries may be captured during the course of the Action or sometime thereafter.
- Actions have associated metadata including provenance
 - Who, what, when, where, why, how, under what conditions, in what context.
 - The corresponding Record Entry captures this metadata along with other Action and Record Entry related information.
- Record Entries may be encapsulated to bind Actor (individual, organization, and/or system) signatures to data and metadata content and data/time of occurrence.
- Actions and related Record Entries capture a chronology of:
 - patient health and healthcare; and
 - operations and services provided in/by a healthcare enterprise.

Persistence, Indelibility, Events

- Each Record Entry serves as persistent evidence of an Action taken, enabling providers to maintain comprehensive information that may be needed for legal, business, and disclosure purposes.
- To satisfy these purposes, Record Entries must also be retained and persisted without alteration.
- Record Entries have both a lifecycle and a lifespan.
- Lifecycle Events include originate, retain, amend, verify, attest, access/view, de-identify, transmit/receive, and more.
- Lifecycle Events occur at various points in a Record Entry lifespan, always starting with a point of origination and retention (i.e., when the Entry is first created and stored).

Pre/Post Event, Entry Content

- A Record Entry may have a pre and post Event state if content is modified.
- In this case, the original Record Entry is preserved (with signature binding) and a new Entry is created (with new signature binding).
- A Record Entry contains data and metadata, in multiple formats, following various conventions and standards.
- Record Entry Content may be:
 - Tagged and/or delimited;
 - Structured (concise, encoded, computable); or
 - Unstructured (free form, non-computable);
 - Encoded as text, document, images, audio, waveforms, in ASCII, binary or other encoding.

EHR-S FM – Sample Conformance Criteria

1 – Originate/Retain Record Entry

- **1.** The system SHALL provide the ability to capture (originate) a Record Entry instance corresponding to an Action instance and context.
- 2. The system SHALL capture a unique instance identifier for each Record Entry.
- The system SHALL capture the signature event (e.g., digital signature) of the origination entry Author, binding signature to Record Entry content.
- **4.** The system SHALL provide the ability to capture both structured and unstructured content in Record Entries.
- 5. The system SHALL provide the ability to capture Record Entries from information recorded during system downtime.
- The system SHOULD provide the ability to integrate Record Entries from Information recorded during system downtime.
- The system SHALL provide the ability to capture date/time an Action was taken or data was collected if different than date/time of the Record Entry.
- 8. The system SHOULD capture metadata that identifies the source of non-originated Record Entry (e.g., templated, copied, duplicated, or boilerplate information).
- 9. The system MAY provide the ability to tag unstructured Record Entry content to organize it according to need, for example, in a time-related fashion or by application-specific groups (such as photographs, handwritten notes, or auditory sounds), or by order of relative importance.
- 10. The system MAY capture and maintain a Record Entry encoded as a standards-based data object (e.g., HL7 Continuity of Care, other HL7 CDA R2 Document, ISO 13606 artifact).
- 11. The system MAY capture and maintain a standards-based data object to mirror (be duplicate and synchronous with) internal Record Entry representation.

↑ At Lifecycle Event Occurrence With Event Evidence→

- The system SHALL audit each occurrence when a Record Entry is originated and retained.
- 2. The system SHALL capture identity of the organization where Record Entry content is originated.
- 3. The system SHALL capture identity of the patient who is subject of Record Entry content.
- The system SHALL capture identity of the individual(s) who performed the Action documented in Record Entry content.
- The system SHALL capture identity of the user who entered/authored Record Entry content.
- **6.** The system SHALL capture identity of the system application which originated Record Entry content.
- IF the source of Record Entry content is a device THEN the system SHALL capture identity of the device.
- The system SHALL capture the Action as evidenced by Record Entry content.
- **9.** The system SHALL capture the type of Record Event trigger (i.e., originate/retain).
- **10.** The system SHALL capture date and time of Action occurrence as evidenced by Record Entry content.
- **11.** The system SHALL capture date and time Record Entry content is originated.
- **12.** The system MAY capture the duration of the Action evidenced by Record Entry content.
- **13.** The system MAY capture the physical location of the Action evidenced by Record Entry content.
- **14.** The system SHOULD capture identity of the location (i.e., network address) where Record Entry content is originated.
- **15.** The system MAY capture the rationale for the Action evidenced by Record Entry content.
- **16.** The system MAY capture the rationale for originating Record Entry content.
- IF Record Entry content includes templates (boilerplate information) or copied (duplicated) information THEN the system SHOULD capture the source of such content.

EHR Record Lifecycle/Lifespan

Dimensions of End-to-End Flow

Record Entry Lifespan

1. Within Single System

- Starting at point of origination, in Source System
- Starting at point of receipt, in Receiving System
- Ending at point of destruction/deletion

2. Across Multiple Systems

- Starting at point of origination, in Source System
- Traversing one or more Points of Exchange
- Ending at point of destruction/deletion, in each System

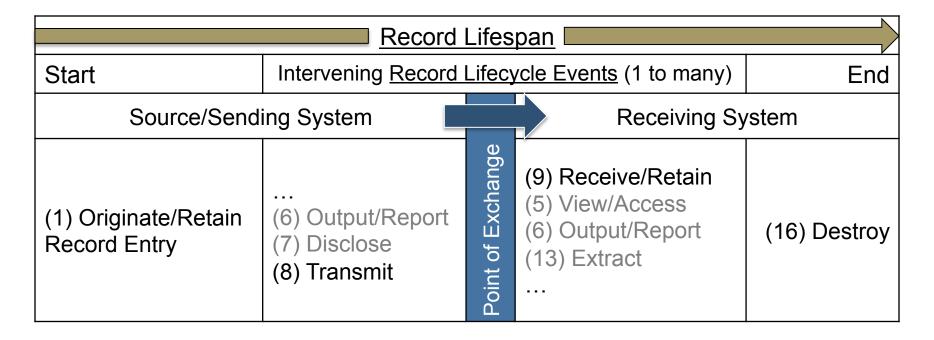

Record Lifespan – End-to-End

Within Single System

Record Lifespan										
Start	Intervening Record Lifecycle Events (0 to many)	End								
Source System (1) Originate/ Retain Record Entry	(2) Amend (3) Translate (25,4) Verify, Attest (5) View/Access (6) Output/Report (7) Disclose (8) Transmit (10) De-Identify	(16) Destroy								
Receiving System (9) Receive/Retain Record Entry	(11) Pseudo-nymize (12) Re-Identify (13) Extract (14,15) Archive, Restore (17,18) Deprecate/Retract, Re-Activate (19,20) Merge, Unmerge (21,22) Link, Unlink (23,24) Place, Remove Legal Hold (26,27) Encrypt, Decrypt	(16) Destroy								

Record Lifespan – End-to-End

Across Multiple Systems

Repeated at each point of exchange...
