

DAF Use Case 2- Targeted Data Access

Use Case Announcements

Please note the Local DAF Use Case has now been consented.

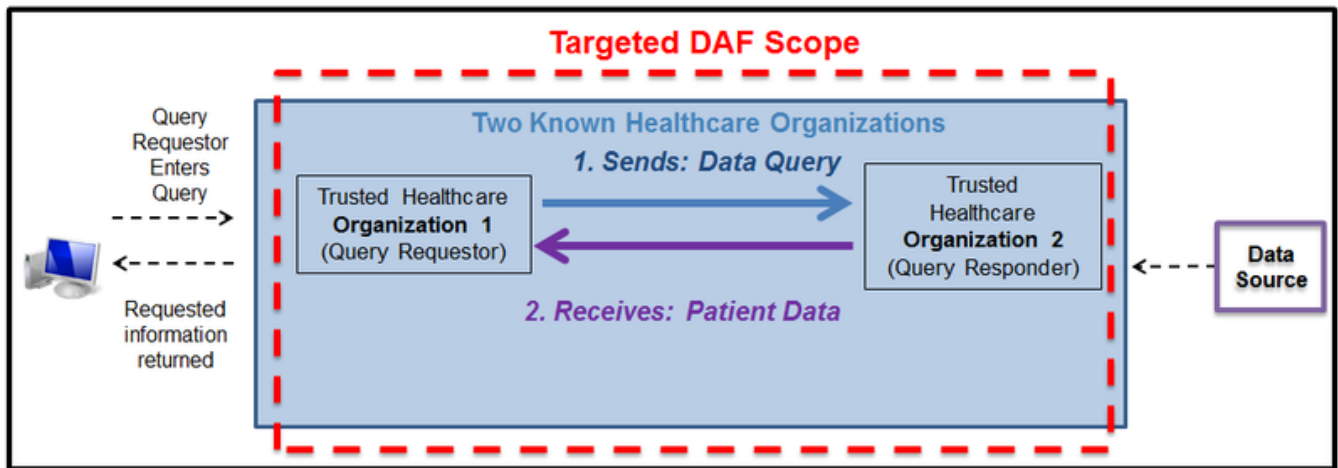

A copy of the consented Targeted Data Access can be found [here](#).

Information on Local DAF Use Case (Phase 1) can be found [here](#).

Targeted DAF Use Case Scope

The scope of the Targeted Data Access Use Case is to define the requirements for inter-organizational access to individual patients. The requirements in this use case will focus on the interchange between applications across two trusted healthcare organizations willing to exchange data. The diagram below illustrates the scope within the larger workflow of a user (e.g. Healthcare Professional) accessing patient data from a trusted external healthcare organization.

Similar to the Local Data Access use case, the use case and functional requirements will enable various types of query mechanisms such as document metadata and data element based queries. Detailed definitions of the data access mechanisms have been posted on the DAF terminology page for reference.
