Notes from the April 27, 2018 call

We discussed the following:

1. Recap of testing:
    a. same HISP worked, the two participants sharing the HISP were able to test the scenario
    b. XDR worked (as it did at the Connectathon)
    c. Need to resolve multi-HISP connectivity
    d. A slightly different issue is the need to manage both organizational-level certificates and direct address-level certificates.
    e. Dmitry Shalimov (NextGen) will start a list of test cases to address commonly expected failures (e.g. an accept that has the wrong referral ID or patient id)
    f. Work on resolution of communications issues between now and next testing session.
    g. Next testing sessions - Wednesday, June 6, 2018, Thursday, June 14, 2018
        i. First session still to focus on successful connectivity, and the possible failures from Dmitry's list
        ii. Second session to focus on content, in particular the C-CDA content
2. Documentation
    a. Individual-level vs organizational-level certificates
    b. HL7 v2 data type flavors
    c. Make sure the metadata is appropriately reflected on the Wiki.
